Art Unit: 1762

1. The Amendment filed 5/22/03 and response filed 6/20/03 have been considered and entered. Claims 1-8 have been canceled. Claims 9-15 have been added and are the only remaining claims active in the case.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 9-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Murayama et al. (6,297,351) in combination with Smith et al. (6,124,372).

Murayama et al. (6,297,351) depicts a fluorinated o-aminophenol polymer. The compounds of components include the same materials used as polymer precursors in the present invention, i.e. dicarboxylic acids (col. 4, line 6 – col. 5, line 7). The polymer is heat treated to form a film (col. 7, lines 27-32) and the dielectric constant can be determined and are 3.0 or less. Murayama et al. (6,297,351) teaches that the polymer film can be used to form multilayered circuit boards (col. 12, line 66 - col. 13, line 6). The polybenzoxazole was dissolved in NMP to form a varnish and Heating was performed up to 350°C (col. 7, lines 15-30).

Smith et al. (6,124,372) teaches the inclusion of thermosetting end groups onto polymers and monomers to enable crosslinking (claims 1 and 20). Smith et al. (6,124,372) teaches

Art Unit: 1762

improved water absorption and high thermal strength due to the crosslinking (col. 19, line 64 – col. 20, line 47),

Page 3

Therefore, it would have been obvious for one skilled in the art to have put thermosetting end groups on Murayama et al. (6,297,351) monomers as evidenced by Smith et al. (6,124,372) with the advantages associated therewith, i.e. lower water absorption and high thermal strength.

Claims 9-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sezi et al. (6,153,350) in combination with Smith et al. (6,124,372) further in combination with Murayama et al. (6,297,351).

Sezi et al. (6,153,350) teaches a polybenzoxazole made from fluorinated o-aminophenol and fluorinated aromatic dicarboxylic acid precursors. (col. 8, line 33 - col. 9, line 53). The precursors are polymerized by heat treatment to form dielectric sheets (col. 1, lines 20-23). A solution is made by dissolving PBO in NMP and applying to a substrate. The film is dried at 120oC and heated at 350oC (col. 12, Example 3).

Sezi et al. (6,153,350) fails to teach thermosetting end groups.

Features described above concerning Smith et al. (6,124,372) and Murayama et al. (6,297,351) are incorporated here.

Therefore, it would have been obvious for one skilled in the art to have put thermosetting end groups on Sezi et al. (6,153,350) monomers as evidenced by Smith et al. (6,124,372) with the advantages associated therewith, i.e. lower water absorption and high thermal strength.
